

MAKING A KILLING *The Untold Story of Psychotropic Drugging*

How Invented Mental “Disorders” Fuel Drug Sales:

This is just one example of how the system works:

Psychiatrist Joseph Biederman is a paid speaker, advisor and researcher for 25 different drug companies.

For more than a decade, Biederman and his colleagues have popularized the existence of “bipolar disorder” in children, without scientific evidence to support this. As a result, there was a 4,000% increase in the diagnosis of bipolar in children since 1994, and the number of antipsychotic drugs prescribed to them leaped fivefold—with an estimated 2.5 million children in the U.S. now on them.

In 2008, Biederman was exposed by a Senate investigation for failing to report in disclosure forms to the university employing him \$1.6 million in personal income from pharmaceutical companies.

But the damage had been done.

Because of the bipolar fad created by Biederman and other psychiatrists, antipsychotics—some of the most powerful psychotropic drugs being prescribed—are psychiatry’s drug of choice. The top three bestselling antipsychotics together gross more than \$23,000 every minute.

And no matter how big the psychiatric drugging industry gets, psychiatrists are hard at work providing the diagnoses to make it even bigger.

Today, anyone may unknowingly be taking a psychiatric drug renamed, repackaged and prescribed for nonpsychiatric purposes. Zyban, prescribed as a cure for smoking, is actually the antidepressant Wellbutrin.

Cymbalta, a psychiatric drug for depression and anxiety, has been proposed by Eli Lilly as Yentreve for urinary incontinence.

Psychiatric researchers are testing psychotropic drugs on such wildly varying conditions as obesity, alcoholism, gambling, hot flashes, herpes, nausea, itching, shivering and excessive hair-pulling.

It is a pill for every ill—and practically no one is being told how dangerous psychiatric drugs are.

With over \$80 billion a year in psychiatric drug money at stake, it is impossible to escape the saturation of psychiatric disease mongering in today’s society.

MAKING A KILLING
The Untold Story of Psychotropic Drugging

The Families of Victims Speak Out:

“Once he started on that drug, he just—the cloud just stayed over him and stayed over him and got darker and darker...”

ANNE S., *brother committed suicide while on Lexapro*

“Everything became worse, each mood swing was worse.”

ALAN K., *daughter hanged herself while on Zoloft*

“He would have chronic headaches, chronic, you know, nausea, not feeling good...”

REBECCA M., *son prescribed Adderall*

“During that time, she was very agitated, very, very jumpy...”

MARION G., *daughter prescribed Zoloft*

“She was having horrible hallucinations.”

SHARON H., *daughter prescribed Zoloft*

“Her personality was disintegrating...”

ANNA G., *daughter prescribed Haldol*

“He thought there wasn’t anything worth living for enough to kill himself? That was not Mathew, it was the drugs doing it.”

DIANE R., *son committed suicide while on Lexapro*

“At least, I would like to have said, ‘I love you.’ I didn’t get a chance to do that.”

ROY G., *son committed suicide while on Clozaril*
